Anti-IDH1 R132H / DIA-H09
Mouse monoclonal anti-brain tumor marker
(Astrocytoma, Oligodendroglioma), Clone H09

Product Information

| Catalog No.: | DIA-H09 (100µg) | Reconstitution: | DIA-H09 (100µg), restore to 500 µl
Reconstitute with sterile distilled water by gentle shaking for 10 minutes |
| Clone: | H09 | Presentation: | In PBS with 2% BSA, 0.05% NaN3, pH 7.4. Antibody purified from culture supernatant |
| Concentration: | 0.2 mg/ml | Applications: | Immunohistochemistry
(standard formalin-fixed paraffin sections) Western blot |
| Isotype: | Mouse IgG2a | Dilutions: | 1:20 Immunohistochemistry (IHC)
1:500 Western Blot |
| Specificity: | Human IDH1 R132H point mutation | Control Antibody: | DIA-W09, rat anti-hu IDH1wt, clone W09 |
| Immunogen: | Synthetic peptide, amino acid sequence CKPIIGHAYGD | | (Staining protocols on www.dianova.com) |
| Physical State: | Lyophilized powder |
| Species: | Human |
| Reactivity: | Oligodendroglioma, diffuse astrocytoma |
| Positive Control: | Pilocytic astrocytoma, primary glioblastoma (ca. 95% of cases negative) |
| Negative Control: | Cytoplasmic |

Reactivity
Antibody clone H09 reacts specifically with the isocitrate dehydrogenase 1 (IDH1) R132H point mutation in tissue sections from formalin-fixed brain tumor specimens. Heterozygous point mutations of IDH1 codon 132 are frequent in World Health Organization (WHO) grade II and III gliomas. IDH1 R132H mutations occur in approximately 70% of astrocytomas and oligodendroglial tumors. The high frequency and distribution of the IDH1 R132H mutation among specific brain tumor entities allow the highly sensitive and specific discrimination of various tumors by immunohistochemistry, such as anaplastic astrocytoma from primary glioblastoma or diffuse astrocytoma WHO grade II from pilocytic astrocytoma or ependymoma. Noteworthy is the discrimination of the infiltrating edge of tumors with IDH1 mutation from reactive gliosis. This antibody is highly useful for tumor classification and in detecting single infiltrating tumor cells.

Instructions for Use

Immunohistochemical staining of standard formalin-fixed paraffin sections
Deparaffinize and rehydrate according to standard procedures. Heat induced epitope retrieval (HIER) is required. For immunohistochemical detection different techniques can be used: Indirect immunoenzyme labeling with a secondary antibody conjugate, biotin/(strept)avidin-based detection, soluble enzyme immune complex or polymer-based detection. To detect antibody, follow the instructions provided with the particular visualization system. The antibody is suited for immunohistochemical staining using automated platforms. Use the antibody at 1:20 dilution for 30min at RT.

Technical note
Diffuse astrocytoma WHO grade II may have low protein-expression. At high dilution of the antibody single tumor cells in the infiltration zone may not be stained.

Intended use / regulatory status
Europe: For In Vitro Diagnostic Use / All other countries: For Research Use only

Storage and Stability
The H09 antibody in lyophilised form is stable for at least one year (-20°C). As reconstituted liquid store at 2-8°C short term (several weeks). For long term storage aliquot and freeze at -20°C or -80°C. Avoid repeated freeze / thaw cycles.

Safety Notes
The material contains 0.05% sodium azide as preservative. Although the quantity of azide is very small, appropriate care should be taken when handling this material. Avoid skin and eye contact, inhalation, and ingestion.

A: Strong reaction of IDH1 mutation specific antibody clone H09 in tumor center of anaplastic oligoastrocytoma.
B: Infiltration zone of anaplastic astrocytoma with specific labelling of infiltrating glioma cells by antibody clone H09.
C: Identification of single tumor cells in white matter distant from tumor center with IDH1 mutation specific antibody clone H09.
D: Cortex infiltrated by oligodendroglioma with specific labelling of tumor cells by antibody clone H09.
E: Double staining of GFAP (glial fibrillary acidic protein, red) and clone H09 (brown) of oligodendroglioma infiltration zone demonstrating specific labelling of tumor cells but not of GFAP positive reactive astrocytes.
F: Strong reaction of IDH1 mutation specific antibody clone H09 with IDH1 R132H mutated diffuse astrocytoma (left) but not with wild type tumor (right).
